

SpaceWire Upper Layer Protocols

*Glenn Rakow - NASA - GSFC
Richard Schnurr - NASA - GSFC
Daniel Gilley - Lockheed Martin
Steve Parkes - University of Dundee, UK*

Agenda

- Statement of Purpose
- Proposal
 - Packet Header
 - Packet Header Format
- Implementation Framework
- Working Group
- Relationships
- Discussion

Statement of Purpose

- **To provide a streamlined approach for developing SpaceWire Upper layer protocols which allows industry to drive standardized communication solutions for real projects**

Proposal

- Agree upon a simple packet header that will allow flexibility in implementing a diverse range of protocols

Packet Header

- **Identification of protocol up front**
 - determine packet format and protocol
- **Maintain header & data alignment 4 byte boundaries**
 - Recommendation - not requirement
 - Simplifies processing of packet by User application
 - Pad header so that data starts on four byte boundaries
 - No need to realign bytes by the User application
- **Helpful if SpaceWire User interface can determine if Logical address present or not**
 - Not necessary with agreed upon format!

Packet Header Format

- First byte - SpaceWire Logical Address
- Second byte - Protocol ID
 - Reserved
 - 0x00
 - 0xFF
 - Used to indicate expansion of the Protocol ID to a total of 32 bits (including original Protocol ID byte)
 - Assignment authority
 - ESA initially receives 32 protocol IDs for assignment
 - NASA initially receives 32 protocol IDs for assignment

Implementation Framework

- Define 2 main working groups to develop SpaceWire protocols
 - ESA
 - NASA
 - NASA Standard working group
 - Being proposed
 - <http://standards.nasa.gov>
 - Will be submitted for request to be adopted as a NASA standard
- Both groups can collaborate but will have independent authority in assigning identification of protocols
 - Allow independence
 - Allow quicker response
 - Provide for different customer base
- Reassign Protocol ID if not used for two years
- NASA would be the "bridge" to handle ITAR issues for US industry
 - Allow possible sharing with Europeans
- Abstract per Protocol submittal to aid in collaboration

Working Groups

- **ESA SpaceWire Working Group**
- **United States Working Group**
 - NASA
 - GSFC
 - Jet Propulsion Lab (JPL)
 - Glenn Research Center (GRC)
 - Department of Defense (DOD)
 - Lockheed Martin
 - Applied Physics Lab (APL)
 - Northrop Gruman Space Technology (NGST)
 - Honeywell
 - BAE SYSTEMS
 - Aeroflex
 - Etc.

Relationships

- ESA maintains the SpaceWire Standard
- All may be included in working groups but ESA and NASA have independent authority to assign a protocol IDs when in their best interest
- Encourage collaboration
